

Measurement : InfoSheet

Digital Screening Estimation

Our suite of screening estimation tools enables businesses to quickly understand the carbon emissions, energy consumption, and energy-related costs associated with their Information and Communication Technology (ICT) usage. These tools, which are intended for screening and estimation purposes only, provide the context for action at the digital product and service level. All tools use the same calculation framework so that comparative measurement and impact can be evaluated.

SEQUOIA™

Desktop Managed Services

Covering all core components of your desktop managed services infrastructure components at office location level. Including desktop PCs, laptops, screens, mobile devices, VOIP telephony and more.

REDWOOD™

Network Managed Services

Covering all core components of your network managed services infrastructure at office and data centre location level. Including routers, LAN, WAN, firewalls and more.

CYPRESS™

Data Centre and Cloud Services

Covering all essential components of your data centre and cloud services, infrastructure components are calculated at the level of the data centre. Including server and storage usage, as well as compute provisioning for cloud service provider offerings. There are five variations of Cypress, and clients can choose from any combination that applies to them:

- On-premise data centres (including private cloud)
- AWS
- Azure
- GCP (Google Cloud)
- OCI (Oracle Cloud Infrastructure)
